Task 2: User Stories

USER STORY

As a **Product Owner**, I want to **Create a video conference applications** so that **we can communicate with other planets.**

As a **video conference participant**, I want to **have an indicator that there is a rapid drop in transmission throughput**, so that **I can distinguish between a natural pause in the conversation and a pause due to throughput issues.**

As a **stakeholders**, I want a **video conference application** so that **when astronauts are sent to space during mission, we can have real time communication from earth and designated planet upon arrival.**

As a video conference participant, I want to receive full video feed of the conversation later, so that in cases when bandwidth was not sufficient to have a live video feed, the video will be sent to me later during the downtime.

As a video conference operator, I want to have automatic rerouting of the connection, when a relay station is out of commission, so that video conference is not interrupted.

As a video conference operator, I want to have the ability to store the recordings, so that video from the video conference can be forwarded to participants during the downtime.
